

ScalePlane

# Brand Identity Guide

Logo system, color palette & typography for enterprise-grade infrastructure-scaling software.

TABLE OF CONTENTS

# Brand Overview

- 01 – Brand Essence & Positioning
- 02 – The Logo – Layered Planes
- 03 – Logo Variants & Usage
- 04 – Color Palette
- 05 – Typography System
- 06 – Applied Examples

01

## Brand Essence

ScalePlane is enterprise infrastructure-scaling software — the platform teams trust to grow compute, data, and services without friction. The brand identity must telegraph three qualities at a glance: reliability (systems that do not fail), precision (engineering rigor, exactness), and enterprise-grade scale (built for growth, from startup to global infrastructure).

Every mark in this guide is built from pure geometric primitives — straight edges, consistent corner radii, and modular grids — rather than organic or illustrative forms. This mirrors how infrastructure itself is composed: modular, layered, and precisely engineered.

| Attribute   | Design Expression                                                            |
|-------------|------------------------------------------------------------------------------|
| Reliability | Solid geometric fills, no gradients or noise, consistent stroke weights      |
| Precision   | Grid-based construction, exact corner radii, mathematically derived curves   |
| Scale       | Ascending / layered compositions — motifs that visually grow or stack upward |

02

# The Logo — Layered Planes

The ScalePlane mark is the Layered Planes — three parallelogram planes that stack with increasing width and a rightward offset, capped by a single amber node at the growth edge. It is the sole primary logo of the brand: a literal, isometric rendering of infrastructure that scales outward and upward, built entirely from modular geometric primitives.

## Primary lockup

## Construction & meaning

Every element of the mark encodes a property of the product. The construction is grid-based: each plane shares an identical vertical step and slant angle, so the stack reads as a single engineered system rather than three unrelated shapes.

| Element                   | Meaning                                                                   |
|---------------------------|---------------------------------------------------------------------------|
| Top plane (Signal Teal)   | Widest layer — the current, most-scaled state; the active growth surface. |
| Middle plane (Deep Blue)  | Scaling tier — the expansion between foundation and leading edge.         |
| Bottom plane (Infra Navy) | Foundation — the stable core infrastructure every layer rests on.         |
| Amber node                | Growth edge — the single accent marking direction of scale; one per mark. |
| Rightward slant + offset  | Forward motion and isometric layering — modular, stackable architecture.  |
| Flat fills, no gradients  | Engineering precision and reliability — no noise, no ornament.            |

03

# Logo Variants & Usage

The Layered Planes mark is the sole primary logo. Three approved variants cover every surface — full color on light, white knockout on navy, and single-color navy for constrained print. Usage rules below apply to all three.

## Approved variants

## Clear space & minimum size

Maintain clear space equal to the height of the amber node on all sides of the mark. Do not scale the icon below 24px in digital contexts or 8mm in print — at smaller sizes use the icon alone without the wordmark.

| Do                                                       | Don't                                                              |
|----------------------------------------------------------|--------------------------------------------------------------------|
| Use full color on white or cloud-white backgrounds       | Do not place the full-color mark on navy (the navy plane vanishes) |
| Use the white knockout variant on navy or dark surfaces  | Do not recolor individual planes or swap the amber node            |
| Preserve the fixed ratio between icon and wordmark       | Do not stretch, skew, rotate, or add drop shadows / bevels         |
| Use single-color navy or white in constrained UI / print | Do not set the amber node against white text (fails AA contrast)   |

04

## Color Palette

A restrained, SaaS-ready palette: a deep navy/blue core for trust and infrastructure gravitas, a single teal secondary for technology and status, and one amber accent reserved exclusively for calls-to-action and key data highlights. Neutrals carry all remaining UI surface area.

|                                                               |                                                                  |                                                                   |                                                                 |
|---------------------------------------------------------------|------------------------------------------------------------------|-------------------------------------------------------------------|-----------------------------------------------------------------|
| <b>Infra Navy</b><br>#0B1F3A<br>Primary — brand core, headers | <b>Deep Blue</b><br>#12386B<br>Primary support — nav, sections   | <b>Signal Teal</b><br>#0F8B8D<br>Secondary — links, active states | <b>Amber Pulse</b><br>#F5A623<br>Accent — CTAs, highlights only |
| <b>Slate</b><br>#4A5A70<br>Neutral dark — secondary text      | <b>Mist Gray</b><br>#E7EAEE<br>Neutral light — borders, dividers | <b>Cloud White</b><br>#FAFBFC<br>Background — app canvas          | <b>Alert Red</b><br>#D64545<br>Semantic — errors only           |

### Usage ratio

Follow a 70 / 20 / 8 / 2 balance: ~70% neutrals (backgrounds, borders, body text), ~20% primary navy/blue (headers, navigation, key UI structure), ~8% secondary teal (interactive elements, status), and ~2% amber accent reserved strictly for primary CTAs and critical highlights. Never let amber compete with itself across a single screen — one call-to-action per view.

### Accessibility

Infra Navy (#0B1F3A) on white and white text on Infra Navy both exceed a 12:1 contrast ratio, comfortably clearing WCAG AA and AAA for body text. Amber Pulse (#F5A623) should always pair with Infra Navy text (never white text) to maintain AA contrast for CTA labels.

05

# Typography System

The type system pairs a geometric grotesk for display and headings with a highly legible humanist sans for body and UI text — engineered precision at large sizes, effortless readability at small mobile sizes.

Display / Headings — Space Grotesk

## Scale with confidence

A geometric, technical grotesk with confident, engineered letterforms — squared apertures and consistent stroke contrast reinforce precision. Use Bold (700) for hero headlines and section titles; Medium (500) for sub-headings and UI labels.

Body / UI Text — Inter

The quick brown fox jumps over the lazy dog — 0123456789

Inter is optimized for screens at small sizes, with excellent legibility on mobile UI, dense dashboards, and data tables. Use Regular (400) for body copy, Medium (500) for emphasis and form labels, Bold (700) sparingly for inline emphasis.

Monospace / Data — JetBrains Mono

\$ scaleplane deploy --env production --replicas 12

Reserved for code snippets, terminal output, API keys, metrics, and tabular numeric data where fixed-width alignment communicates technical accuracy.

### Web & mobile pairing recommendation

| Role                  | Typeface       | Weight        | Web size | Mobile size |
|-----------------------|----------------|---------------|----------|-------------|
| Hero / Display        | Space Grotesk  | Bold (700)    | 40–64px  | 28–36px     |
| Section heading       | Space Grotesk  | Medium (500)  | 22–28px  | 18–22px     |
| Body copy             | Inter          | Regular (400) | 16px     | 15px        |
| UI labels / buttons   | Inter          | Medium (500)  | 14px     | 14px        |
| Captions / metadata   | Inter          | Regular (400) | 12–13px  | 12px        |
| Code / data / metrics | JetBrains Mono | Regular (400) | 13–14px  | 13px        |

Line length: constrain body paragraphs to 60–75 characters per line on web for readability. Leading: 1.5× body size, 1.2× for headings. Never set Inter below 12px or Space Grotesk below 18px on any interface.

06

## Applied Examples

A quick reference for how the system comes together across common product and marketing surfaces.

Primary lockup on light background

Recommended CTA button styling

An orange rectangular button with the text "Start scaling" in a dark blue, sans-serif font.

Amber background, Infra Navy label text, Inter Bold, 8px corner radius, 44px min touch target on mobile.

### Closing note

This guide establishes the foundation for ScalePlane's visual identity around a single mark — the Layered Planes. The logo, palette, and type system share one construction logic, so the brand reads as a single engineered product across every surface. With the primary direction locked, the next step is exporting production lockups, favicon and app-icon sets, and minimum-size variants for constrained UI.
